Your Mission: Use F-Response to access Office 365 SharePoint
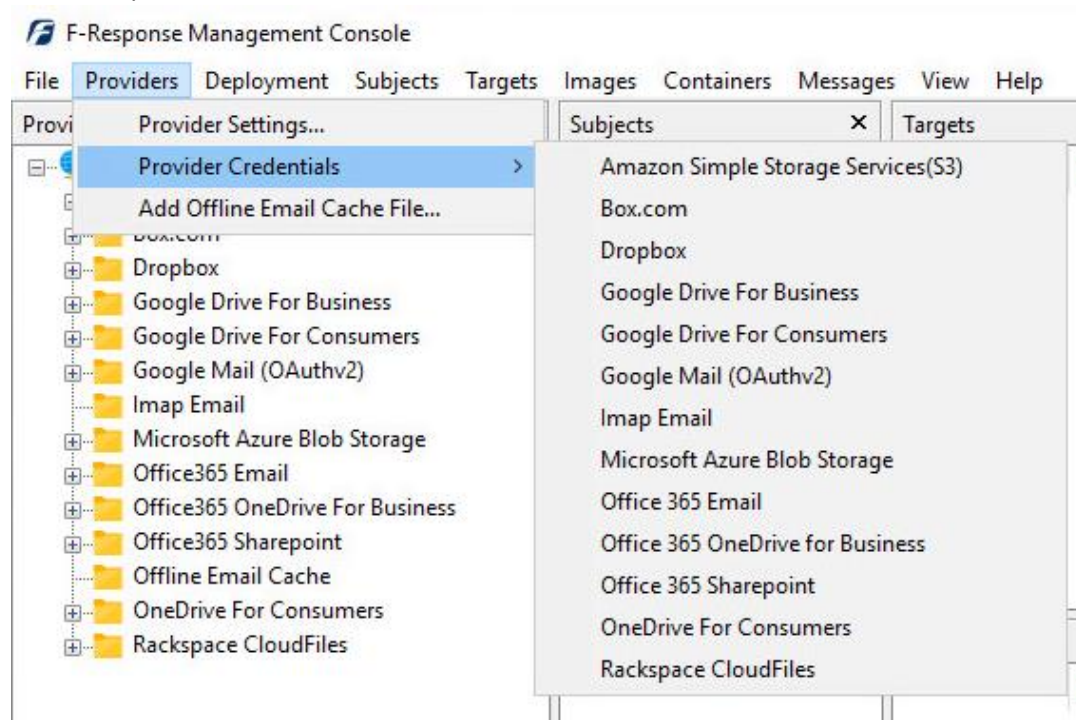

Using F-Response to connect to Office 365 SharePoint and collect its contents

Step 1: Open SharePoint Credential Configuration Window

Open the F-Response Management Console and navigate to the Providers->Provider Credentials->Office 365 Sharepoint menu item.

F-Response Management Console

Step 2: Open URL or Copy to Clipboard

The first step in obtaining access to the Office 365 SharePoint account is to request access either via the browser directly, or if you do not have access to the account in question, copying the request URL to the clipboard to be shared with the account holder via email, IM, etc.
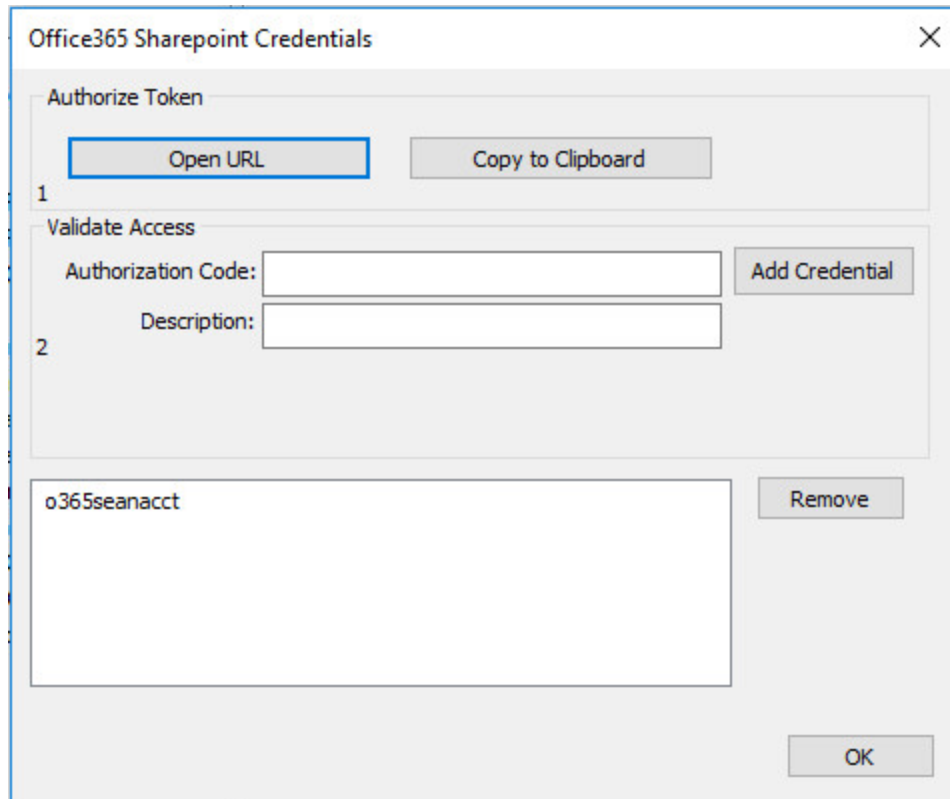

Credentials Dialog

Regardless of the method chosen, the web browser user will be asked to login to Office 365 and authorize the F-Response Connector, upon completion they will be redirected to the F-Response website where an Authorization code will be presented. This is the Office365 Authorization Code. That code and a Description must be inputed into the dialog window. Press Add Credential to verify and add this credential.

Step 3: Scan and Enumerate Office 365 SharePoint accounts

Double click on the newly added Office 365 Sharepoint account under the Providers tree. This will scan the provider and result in a listing of available targets in the Targets window.
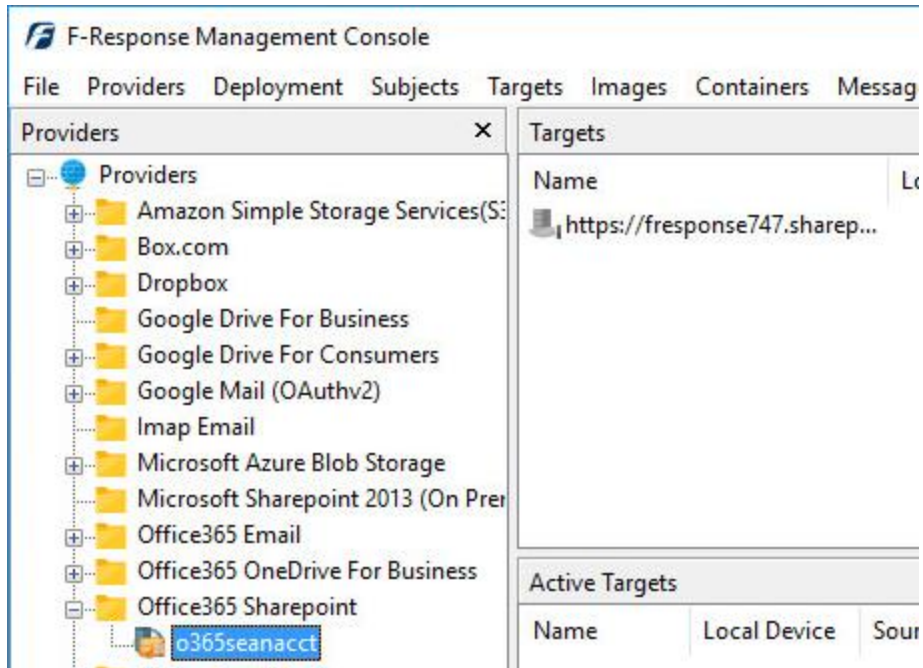

Listing Targets

Step 4: Login and Mount one or more Office 365 SharePoint Targets

Double click on an individual target in the Targets window to begin the mounting process. Once attached the share will present a drive letter.

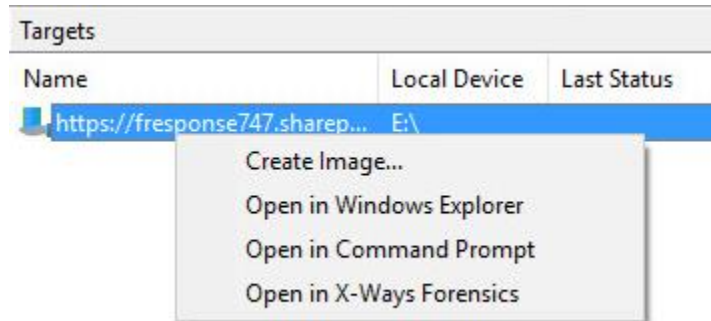

Attached Volume

Step 5: Create Image of attached volume

Select the newly attached target and right click on the Local Device column. Use the "Create Image…" option to open the "Image" dialog to begin imaging the device.

Start Imaging Process…

Step 6: Complete Imaging Options…

We'll work through this window from the top down. First, the **Source Type** is set to **Virtual** (by default) to be able to create an image of the connected virtual device data.

Next you can select the image **Format**— you have a choice **E01** (Expert Witness), **VHD** (Virtual Hard Disk), or **Both**. This option determines what the Imager will provide at the end of the collection.

Image Source should be populated if we opened this window from Windows Explorer, just verify the drive letter is correct from Step 1. For **Image Path** we need to choose our destination drive—this must be a physical drive attached to our examiner machine (we cannot image to a network share).

Next we can choose a **Hash** format and the **Compression** level if you wish to compress the resulting image file. The remaining fields are specific to your case and can be filled out accordingly. These fields will be included in the resulting log file for the image.

Once you have all your information entered simply click the **Start Image** button to begin the process.

Step 7: Review the Image

Once started the dialog will close and you'll be able to monitor the image using the Active Images. When the Image completes you will see it move to Completed Images.

Imaging started and running...

Step 8: Review the Completed Image

Right click on the completed image to access the Image Path, Log, and File List. These logs and listings contain details about the image, the image itself, and a file listing of files collected.

Reviewing the completed image.
